is acoustic diffusion panel by using non-linear convex
ellipses which were later altered and optimised in order to
better angular diffusion coverage.
This panel was selected out of some materials that have the
properties required for a diffuser with these characteristics.
Some advantages, namely UV protection, impact resistance
and fire resistance.
The surface is composed of a substance made of impregnated
minerals which gives this product a specific mass and also contributes
to its acoustic properties. Its shape adjusts to even
surfaces, whether on T¹⁶ profile false ceilings or on walls, by using our glues or
fasteners.
